Subject:

Rush search request for 09/403440

Please search in commercial database, issued patent files and PGUB:

The peptide SEQ ID NO:2, with and without size limitation for the sequences in the database to the size of SEQ ID

NO:2.

Thank you.

MINH TAM DAVIS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mammalia;
                                                                                                                                                                                                                                                                                                                                              expression.

COPACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Binds DNA as a homotetramer. Found in a complex with

CABLES1 and p53/TP73. Interacts with histone acetyltransferases

EP300 and methyltransferases HRWT1L2 and CARM1, and recruits them

to promoters. C-terminus interacts with TAF1, when TAF1 is part of

the TFIID complex. Interacts with HIPK1, HIPK2, AXIN1, and

P53DINP1. Part of a complex consistiting of TP53, HIPK2 and AXIN1.

Interacts with WMOX (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).
                                                                                                  SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity). PTM: Phosphorylated. Phosphorylation on Ser residues mediates transcriptional activation. Phosphorylated on Thr-18 by VRK1, which may prevent the interaction with MDM2. Phosphorylated by HIPKI (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of the control of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BAX and FAS antigen expression, or by repression of

COFACTOR: Binds 1 zinc ion per subunit (By Binds 1 zinc ion per subunit ion zomplex with SUBUNIT: Binds DNA as a homoceteramer. Found in a complex interacts with Mari, and recruits the to promoters. C-terminus interacts with Mari, when TAF1 is part the TFIID complex. Interacts with HIPK1, HIPK2, AXIN1, and PS3DINP1. Part of a complex consisting of TPS3, HIPK2 and AXIN Interacts with WWOX (By Similarity).

Interacts with WWOX (By Similarity).

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 similarity).

DISBASE: p53 is found in increased amounts in transformed cells. p53 is frequently mutated c many types of cancer.

SIMILARITY: Belongs to the p53 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBCELIULAR LOCATION: Cytoplasmic and nuclear (By similarity)
PTM: Phosphorylated. Phosphorylation on Ser residues mediates
transcriptional activation. Phosphorylated on Thr-18 by VRKI,
which may prevent the interaction with MDM2. Phosphorylated b

-!- SIMILARITY: Belongs to the p53 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BC1-2
                                                                                                                                                                                                                                                                                                                                                                                                                           EP300 and methyltransferases HRMT112 and CARM1, and recruits to promoters. C-terminus interacts with TaF1, when TaF1 is par the TFIID complex. Interacts with HIFK1, HIFK2, AXIN1, and P53DINP1. Part of a complex consisiting of TP53, HIFK2 and AXI Interacts with WWOX (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity). SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity). First Phosphorylated. Phosphorylation on Ser residues mediates transcriptional activation. Phosphorylated on Thr-18 by VRK1, which may prevent the interaction with MDM2. Phosphorylated by HIFK1. Phosphorylated on Ser-46 by HIFK2 upon UV irradiation. Phosphorylation on Ser-46 is required for acetylation by CREBH Phosphorylation on Ser-46 is required for acetylation by CREBH
                                                                                                                                                                                            similarity).

FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of
                                                                                                                                                 transformed cells. p53 is frequently m many types of cancer.
SIMILARITY: Belongs to the p53 family.
                                                                                                                                                                                                                                                                                                       SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity). PTM: Phosphorylated. Phosphorylation on Ser residues mediates transcriptional activation. Phosphorylated on Thr-18 by VRK1, which may prevent the interaction with MDM2. Phosphorylated on Thr-55 by TAF1 which promotes MDM2-mediated p53 degradation. Phosphorylated by HIPK1 upon Phosphorylated by HIPK1. Phosphorylated on Ser-46 by HIPK2 upon
                                                                                                                                                                                                                                                                                                                                                                                                           CABLES1 and p53/TP73. Interacts with histone acetyltransferases EP300 and methyltransferases HRWT1L2 and CARM1, and recruits them to promoters. C-terminus interacts with TAF1, when TAF1 is part of the TFIID complex. Interacts with HIPK1, HIPK2, AXIN1, and P53DINP1. Part of a complex consisiting of TP53, HIPK2 and AXIN1. Interacts with WMOX (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CERAE

Somatic mutations in the p53 gene account for the extension of "Somatic mutations in the pcause cells.",

replicative life span of macaque cells.",

Biochem. Biophys. Res. Commun. 295:644-650(2002).

-i- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of new antigen expression, or by repression of Bcl-2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- SIMILARITY: Belongs to the p53 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression.

COPACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Binds DNA as a homotetramer. Found in a complex with SUBUNIT: Binds DNA as a homotetramer. Found in a complex with SUBUNIT: Binds DNA as a homotetramer. Found in a complex with SUBUNIT: Binds DNA as a homotetramer. Found in a cetyltransferases EP300 and methyltransferases HRWFI12 and CARW1, and recruits the DPIOMOTETS. Creminus interacts with TAF1, when TAF1 is part the TFIID complex. Interacts with HIPK1, HIPK2, AXIN1, and P53DINP1. P53DINP1. Part of a complex consisting of TP53, HIPK2 P53DINP1. Interacts with WWOX (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).

PTM: Acetylated. Its deacetylation by SIRI impairs its ability in the complex consists of the complex consists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       by CREBBP (By similarity).
DISEASE: p53 is found in increased amounts in a wide variety transformed cells. p53 is frequently mutated or inactivated:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PTM: Phosphorylated. Phosphorylation on Ser residues mediates transcriptional activation. Phosphorylated on Thr-18 by VRKI, which may prevent the interaction with MDM2. Phosphorylated on Thr-55 by TAF1 which promotes MDM2-mediated p53 degradation. Phosphorylated by HIPKI. Phosphorylated on Ser-46 by HIPK2 upon irradiation. Phosphorylation on Ser-46 is required for acetylati

SIMILARITY: Belongs to the p53 family.
```

밁 S

```
-
FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
```

expression.

COPACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Binds DNA as a homotetramer (By similarity). Found in a complex with CABLES1 and p53/TP73 (By similarity). Interacts with histone acetyltransferases EP300 and methyltransferases HRWT1L2 and CARMI, and recruits them to promoters. Interacts with WWOX Found in a steracts with (Ву

similarity).
SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).
PTM: Phosphorylated on Thr-18 by VRKI, which may prevent the interaction with MDM2 (By similarity).
FTM: Acetylated. Its deacetylation by SIRT1 impairs its ability.
FTM: Acetylated. Its deacetylation by SIRT1 impairs (By DTM).

induce proapoptotic program and modulate cell impairs its ability promotes MDM2-mediated senescence (By ő

PTM: Phosphorylated on Thr-55 by TAF1 which promotes MDM2-med p53 degradation (By similarity).
DISEASE: p53 is found in increased amounts in a wide variety transformed cells. p53 is frequently mutated or inactivated in the promotes of the promotes are promoted by the promoted by the promotes are promoted by the p

                                          expression.

COPACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Binds DNA as a homotetramer: Found in a complex with

CABLES1 and p53/TP73. Interacts with histone acetyltransferases

EP300 and methyltransferases HRMT1L2 and CARM1, and recruits them

to promoters. C-terminus interacts with HIPK1, when TAF1 is part of

the TFIID complex. Interacts with HIPK1, HIPK2, AXIN1, and

P53DINP1. Part of a complex consisting of TP53, HIPK2 and AXIN1.

Interacts with WWOX (By similarity).
                            SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity). PTM: Acetylated. Its deacetylation by SIRT1 impairs its ability to
                 induce proapoptotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12

Submitted (AUG-1999) to the EMBI/GenBank/DDBJ databases.
-!- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MOD_RES

SUBUNIT: Binds DNA as a homotetramer. Interacts with histone subunit: Binds DNA as a homotetramer. Interacts with histone acetyltransferases EP300 and methyltransferases HRWT112 and CARM1, and recruits them to promoters. C-terminus interacts with HIPK1, and psiding of the TFIID complex. Interacts with HIPK1, when TAF1 is part of the TFIID complex consisting of TP53, HIPK2, AXIN1, and P53DINP1. Part of a complex consisting of TP53, HIPK2, AXIN1, Interacts with WWOX (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).

PTM: Acetylated. Its deacetylation by SIRT1 impairs its ability to

                                                                                                                                                                                                                       transcriptional activation. Phosphorylated on Thr-18 by VRKI, which may prevent the interaction with MDM2. Phosphorylated of Thr-55 by TARI which promotes MDM2-mediated p53 degradation. Phosphorylated by HIPK1 (By similarity). Phosphorylated on Se by HIPK2 upon UV irradiation. Phosphorylation on Ser-46 is required for acetylation by CREBBP (By similarity). DISEASE: p53 is found in increased amounts in a wide variety.
                                                                                                                                                                                                                                                                                                                                                   PTM: Phosphorylated. This sequence is a peptide homologue of a region of p53 which binds to mdm2. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells do not overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows level p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 function. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with

non-functional p53

New substance with a mdm2 binding domain and coupling partner  $\cdot$  useful for stabilising in cells without an efficient mdm2-mediated degradation

WPI; 1998-609975/51.

This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells do not overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 function. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 19
                                                                                                                                                                                                                                                                                       New agents which inhibit interaction of p53 and mdm2 - useful activating p53, e.g. for treating cancers, viral conditions of conditions associated with non functional p53 or mdm2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             p53 homologue

binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2. The peptides may be used to identify molecules that bind to MDM2 and to identify and design inhibitors of MDM2/p53 binding. They may also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia patients and for treatment or prevention of disease involving p53/MDM2 interactions, especially tumours and viral infections. The peptides can be administered nasally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and accumulation in normal cells. The peptides which mimic the MDM2 binding site in p53, have a significantly greater blocking activity compared with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         assay for analysing the interaction between human oncogenic protein MD and p53. The invention provides peptide derivatives capable of binding the human MDM2. These peptides can specifically inhibit or block the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Compounds binding to MDM2 protein and inhibit its useful in, e.g. diagnosis and treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lane D, Boettger V,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a peptide for use in modulating the binding of p53 polypeptide to a p300 polypeptide. The new peptide is useful in modulating the binding of a p53 polypeptide to a p300 polypeptide. The peptide may be used to regulate the mammalian cell cycle or to induce or prevent cell death, for the treatment of cancer or ischaemia. The invention is useful in gene therapy. The present sequence is EGFP-BOX-1 domain phospho-peptide used in the exemplification of the invention
                                                                                                                                                                                                                11-MAY-1994.
                                                                                                                                                                                                                                                                                                                                                               transformation-associated protein.

                                 Antibodies specific for p53 are detected by binding to immobilised fragments of the p53 gene product containing the antibody-binding region. Preferred fragments contain amino acids 1-241, 40-349, 40-393, 66-241, 66-393, 237-349, 237-393 and esp. 9-33, 37-52 or 368-386. See AARS1872-R51881 for requences of these fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptides derived from the N-terminal (amino acids 1-112) or the C-terminal (amino acids 350-393) of protein p53 which specifically react with anti-p53 antibodies in patients with cancer or precancerous conditions are claimed. The peptides (AAR54907-R54921) are useful for detecting and monitoring cancerous and precancerous conditions. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                     Non-radioactive detection of p53 specific antibodies - by capture immobilised p53 or its fragments, then reaction with labelled seccantibody, for diagnosis of tumours and suitable for screening.
                                                                                                                                                                                                                                                                                                                                                                                                          Human nuclear phosphoprotein p53; tumour suppressor gene product; anti-oncogene; cancer; tumour; antibody binding region; epitope.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides AAM60202-05 are derived from human p53 protein. The present peptide corresponds to residues 11-35. The pptides are used in the method of the invention Antibodies that bind to p53 protein are detected by immobilising a p53 peptide directly on to a flow cell of a sensor chip in a biosensor, treating the peptide with a sample of patient serum, diluted in buffer, and measuring binding of antibody to the peptide using the biosensor. The method is used to monitor cancer patients undergoing p53 gene therapy (to determine if an immune response has developed), and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting antibodies that bind p53 by reaction with immobilised p53 peptide(s) - attached directly to flow cells in the sensor chip of biosensor, used to analyse serum from cancer patients, e.g. those being given p53 gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAW60202

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes a method of synthesis of biologically active CC substances of determined structure directly in the cells of living CC organisms containing specific RNA or DNA sequence. The method is based on CC the hybridisation of two or more oligomers bound with biologically CC inactive substances to specific RNA or DNA in vivo in the cells of living CC organisms. After hybridisation of the oligomers, the biologically CC inactive precursors bound to the oligomers can interact with each other CC to make the active form of the substances. This changing of properties is CC due to chemical reactions which bind the biologically inactive precursors CC through a chemical bond into a biologically active form of the whole compound. The methods are useful for producing biologically active compounds from inactive precursors. These compounds may be inhibitors or Stimulators of cellular metabolism, DNA replication, RNA transcription, CC RNA translation, RNA elongation RNA processing, protein synthesis, CC protein processing, cellular protein and RNA transportation, processes of CC cellular oxidation, toxins, proteins or RNAs. AAB30523-36 represent CC peptides are fragments of the tumour suppressor p53, and the oligomers and CC norduce the tumour suppressor p53, and the oligomers and CC unreduce the tumour suppressor p53 from the bound postides and

                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of identifying a ligand that can mediate the biological activity of target protein via inhibition of the binding of target protein to a binding partner ligand comprising screening first combinatorial library having first member ligands for binding to target protein to identify target—binding ligand(s). The method is useful for identifying ligands that can mediate the biological activity of target proteins via inhibition of the binding of target proteins to a binding partner ligand. The invention does not require that the natural binding partner be used as reagent. The need for the natural binding partner be used as reagent. The need for the natural binding partner be used as reagent. The need for the natural binding partner be used as reagent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method (MI) for identifying a ligand which can mediate the biological activity of a target protein via inhibition of the binding of a target protein to a binding partner. The method comprises identifying target-binding ligands by screening first member ligands of a first library, obtaining ligands which inhibit the binding of target-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying ligand mediating activity of target protein, by screening ligand libraries to obtain target-binding ligands and ligands inhibiting binding of target-binding ligand to target, determining ligands inhibiting activity of target.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (FOWL/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The peptides AAW13602-6 represent peptide fragments derived from the wild Ctype human p53 protein. This peptide corresponds to amino acids 6-41 of Ct the p53 sequence. The peptides are claimed peptides which are able to Ct bind the N-terminal amino acids (1-134) of the murine double minute-2 (mdm2) protein (AAW13600). Mdm2 protein is a 90 kD phosphoprotein which CC binds and modulates the activity of the tumour suppressor protein p53. It CC has now been shown that the mdm2 protein itself has oncogenic properties, CC cycle arrest in G1 caused by over-expression of the p107 protein. The p53 CC cycle arrest in G1 caused by over-expression of the p107 protein. The p53 CC cycles are examples of antagonists of the invention which are able to CC inhibit the oncogenic activity of mdm2. The antagonists are used to treat CC e.g. adenocarcinoma of the colon; cancer of the breast, lung or stomach; CC myeloid leukaemia; B cell lymphoma, or other hyperproliferative conditions such as restenosis. Note: this sequence is not given in the CC specification but is constructed from the wild type human p53 sequence

                                                                                                                                                                                                                               The peptides AAW13602-6 represent peptide fragments derived from the wild CC type human p53 protein. This peptide corresponds to amino acids 1-41 of CC the p53 sequence. The peptides are claimed peptides which are able to CC bind the N-terminal amino acids (1-134) of the murine double minute-2 (mdm2) protein (AAW13600). Mdm2 protein is a 90 kD phosphoprotein which CC binds and modulates the activity of the tumour suppressor protein p53. It CC binds and shown that the mdm2 protein itself has oncogenic properties, especially in a p53-mull background. Mdm2 is observed to unblock cell CC cycle arrest in G1 caused by over-expression of the p107 protein. The p53 CC speptides are examples of antagonists of the invention which are able to CC inhibit the oncogenic activity of mdm2. The antagonists are used to treat CC e.g. adenocarcinoma of the colon, cancer of the breast, lung or stomach; myeloid leukaemia; B cell lymphoma, or other hyperproliferative CC conditions such as restenosis. Note: this sequence is not given in the CC specification but is constructed from the wild type human p53 sequence

Specifically, it refers to a sandwich method that involves assaying an anti-human immunoglobulin antibody to determine the presence or absence of an autoantibody with respect to the p53 gene product in a test substance (such as blood) and comparing these values with a standard control from a healthy subject. The present invention describes a method based on a chemiluminescent enzyme immunoassay. As such, it provides an accurate and sensitive assay that can be used to detect and diagnose a second control from the present invention describes and accurate and sensitive assay that can be used to detect and diagnose a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The peptides AAW13602-6 represent peptide fragments derived from the wild CC type human p53 protein. This peptide corresponds to amino acids 1-52 of CC the p53 sequence. The peptides are claimed peptides which are able to CC bind the N-terminal amino acids (1-134) of the murine double minute-2 (mdm2) protein (AAW13600). Mdm2 protein is a 90 kD phosphoprotein which CC binds and modulates the activity of the tumour suppressor protein p53. It CC especially in a p53-null background. Mdm2 is observed to unblock cell CC cycle arrest in G1 caused by over-expression of the p107 protein. The p53 CC peptides are examples of antagonists of the invention which are able to CC inhibit the oncogenic activity of mdm2. The antagonists are used to treat c e.g. adenocarcinoma of the colon; cancer of the breast, lung or stomach; CC myeloid leukaemia; B cell lymphoma, or other hyperproliferative conditions such as restenosis. Note: this sequence is not given in the cCC specification but is constructed from the wild type human p53 sequence
